Porphyromonas gingivalis genes and proteins - used in the detection and vaccination against periodontal disease.

Claim 4; Page 114-115; 153pp; English.

HARP94 (AAR96024) is the product of the HArep4 repeat unit (AAT30648) of the hagA gene (AAT30654) of P. gingivalis 318. It forms part of haemagglutinin hagA (see also AAR96030). HArep4 and other hagA repeat unit products (see also AAR96021-23) can be obtd. from transformed host cells and used as vaccines to protect humans or animals against periodontal disease. Expression in Salmonnella cells allows prodn. of live vaccine. HArep1-4 can also be used to detect the presence of anti-P. gingivalis antibodies and to raise monoclonal antibodies for diagnostic appln. (Updated on 16-0CT-2003 to standardise OS field)

    This sequence is encoded by a Porphyromonas gingivalis gene of the invention. This sequence represents the hagA haemagglutinin protein. I polypeptides are used to produce antibodies to organisms associated wi periodontal disease. The antibodies are also used in purification and identification procedures. The genes and polypeptides are used as vaccines against periodontal disease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 420
                                                                                                                                                                  P. gingivalis 381 haemagglutinin hagA (AAR96030) was identified as the product of the hagA gene (AAT30654) isolated as an BCORV fragment of genomic DNA. The haemagglutinin, or portions of it (see also AAR96021-24), can be obtd. from transformed host cells and used as a vaccine to protect humans or animals against periodontal disease. Expression in Salmonella cells allows produ. of a live vaccine. The haemagglutinin can also be used to detect the presence of anti-P. gingivalis antibodies and to raise monoclonal antibodies for diagnostic appin. (Updated on 16-0CT-2003 to standardise OS field)

This sequence represents the hagA haemagglutinin protein. T polypeptides are used to produce antibodies to organisms associated wi periodontal disease. The antibodies are also used in purification and identification procedures. The genes and polypeptides are used as vaccines against periodontal disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DDIQFTMGGSPTPTDYTYTVYRDGTKIXEGLTETTFEEDGVATGNHEYCVEVKYTAGVSP

HARPEQ2 (AAR96022) is the product of the HARPEQ2 repeat unit (AAT30646) of the hagA gene (AAT30654) of P. gingivalis 318. It forms part of the hagA (see also AAR96030). HARPEQ2 and other hagA repeat unit productin (see also AAR9601301 and AAR96023-24) can be obtd. from transformed host cells and used as vaccines to protect humans or animals against periodontal disease. Expression in Salmonella cells allows product live avaccine. HARPEL-4 can also be used to detect the presence of antio-P. gingivalis antibodies and to raise monoclonal antibodies for diagnostic appln. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         transformed host cells and used as vaccines to protect humans or animals against periodontal disease. Expression in Salmonella cells allows produced live vaccine. Harepl-4 can also be used to detect the presence of anti-6-p. gingivalis antibodies and to raise monoclonal antibodies for diagnostic appln. (Updated on 16-OCT-2003 to standardise OS field)

This sequence represents the hagA haemagglutinin protein. The polypeptides are used to produce antibodies to organisms associated with periodontal disease. The antibodies are also used in purification and identification procedures. The genes and polypeptides are used as vaccines against periodontal disease

                                                                                                                HAREPI (AAR96021) is the product of the HAREPI repeat unit (AAT30645) of the hagA gene (AAT30654) of P. gingivalis 318. It forms part of haemagglutinin hagA (see also AAR96030). HAREPI and other hagA repeat unit products (see also AAR96030). Harepi and other hagA repeat cells and used as vaccines to protect humans or animals against periodontal disease. Expression in Salmonella cells allows produ. of live vaccine. HAREPI-4 can also be used to detect the presence of anti-P. gingivalis antibodies and to raise monoclonal antibodies for diagnostic appln. (Updated on 16-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                        P. gingivalis 381 haemagglutinin hagE (AAR96033) was identified as the product of a gene (AAT30656) identified in P. gingivalis 318 genomic DNA. The haemagglutinin can be obtd. from transformed host cells and used as evaccine to protect humans or animals against periodontal disease. Expression in Salmonella cells allows prodn. of a live vaccine. The haemagglutinin can also be used to detect the presence of anti-P. gingivalis antibodies and to raise monoclonal antibodies for diagnostic appln. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         122 ANALLEEVLTAKTVVTAPEAIRGTRVQGTWYQKTVQLPAGTKYVAFRHFGCTDFFWINLD

                                                                                                                                                                                                                                                                                                           This sequence is encoded by a Porphyromonas gingivalis gene of the invention. This sequence represents the haga haemagglutinin protein. The polypeptides are used to produce antibodies to organisms associated with periodontal disease. The antibodies are also used in purification and identification procedures. The genes and polypeptides are used as vaccines against periodontal disease

AG (AG-2) were isolated from P. gingivalis strains H66 (ATCC 33277) and W50 (ATCC 53973). The sequences of the proteins were used to design PCR primers and probes to isolate AG DNA. Lambda DASH and lambda ZAP libraries were screened with a probe based on amino acids 11-22 of the AG protein to obtain DNA encoding AG-1 (AAQB3484) and AG-2 (AAQB3489). AG-2 correct PN field.)

This sequence represents the hagE haemagglutinin protein. The polypeptides are used to produce antibodies to organisms associated with periodontal disease. The antibodies are also used in purification and identification procedures. The genes and polypeptides are used as vaccines against periodontal disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       62

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a Porphyromonas gingivalis arginine-specific proteinase known as Arg-gingipain/gingipain-2 amino acid sequence. Gingipain-2 consists or a 50kD protease component non-covalently associated with a 44kD haemagolutinin component. The proteinase is stimulated by glycine containing peptides and glycine analogues. It is inhibited by cysteine protease group specific inhibitors. The protease preparation can be used in immunogenic compositions and vaccines against inflammatory response and tissue damage caused by P. gingivalis in periodontal disease. It can also be used to screen for agents that modulate Arg-gingipain proteinase activity inhibitors

"Complete genome sequence of the oral pathogenic bacterium Porphyromonas gingivals strain W83.";

J. Bacteriol. 185:5591-5601(2003).

J. Bacteriol. 185:5591-5601(2003).

J. FUNCTION: Agglutinates erythrocytes (By similarity).

-: SIMILARITY: Belongs to peptidase family C25.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Hemagglutinin; Virulence; Hydrolase; Thiol protease; Signal; Repeat;
